

## LOCALIZED WASTE-INTERCEPTION & CIRCULAR RESOURCE-RECOVERY PILOT

Freetown, Sierra Leone | September 2026

---

### PURPOSE

YSI proposes a bounded local pilot that intercepts waste closer to where it leaks into the environment, measures and characterizes the stream, separates recoverable materials, tests realistic value pathways and documents operating performance before any replication decision.

### OPERATING SEQUENCE

1. Define a lawful, bounded pilot geography and coordination pathway.
2. Intercept / collect waste voluntarily within the agreed local scope.
3. Weigh, log and characterize incoming material.
4. Inspect and sort material streams using safe handling controls.
5. Route recyclable / recoverable materials to validated pathways.
6. Prepare only technically suitable non-hazardous combustible material for gated RDF/SRF testing where justified.
7. Measure cost, mass balance, quality, environmental controls and operational performance.
8. Decide: replicate, modify, stop, or undertake further technical validation.

### WHAT THE PILOT IS NOT

- Not a claim that YSI is Freetown's official municipal waste collector.
- Not a claim that YSI currently operates an RDF/SRF facility or has commercial offtake.
- Not a fixed citywide rollout before Pilot 1 proves the operating model.
- Not a substitute for FCC, EPA-SL or other competent authority requirements.

### EXPECTED EVIDENCE OUTPUTS

- Auditable weight and material-flow records.
- Waste-composition / characterization data.
- Recovery-route and quality evidence.
- Unit-cost and operating-time evidence.
- Environmental, health-and-safety and incident records.
- A replication decision based on measured performance.

## CONTROLS, MONITORING & FUNDING READINESS

---

### GOVERNANCE & OPERATING CONTROLS

- Financial management: documented approvals, supporting evidence, restricted-fund identification and reconciliation.
- Safeguarding: adopted working policy, code of conduct and interim reporting route; focal-point mechanisms still being strengthened.
- Field safety: pre-activity risk assessment, stop-work authority, PPE, hazardous-waste isolation, incident/near-miss reporting.
- Authority coordination: activity-specific legal, municipal and environmental requirements must be clarified before physical work.

### MONITORING STANDARD

Future pilot records should capture date, site, gross/net weight, weighing method, material category, destination, recovery pathway, responsible staff, supporting evidence, operating time, costs, incidents and corrective actions. This creates a mass-balance and accountability trail suitable for funder reporting and replication decisions.

### BUDGET FRAMEWORK - COSTS TO BE VALIDATED

- |                                         |                                                   |
|-----------------------------------------|---------------------------------------------------|
| - Field labor and supervision           | - Material-recovery testing                       |
| - Collection / interception materials   | - Technical / laboratory support where justified  |
| - Weighing and data-recording equipment | - Safeguarding, safety and environmental controls |
| - Sorting / handling tools and PPE      | - Monitoring, reporting and audit / assurance     |
| - Transport / authorized disposal       | - Contingency subject to funder rules             |

### FUNDING POSITION

YSI is not publishing a fixed donor ask or a claimed pilot capacity before technical scope, equipment, regulatory requirements, local prices and implementation partners are validated. A funder-specific budget can be developed from a bounded pilot design and costed bill of quantities.

### INSTITUTIONAL READINESS POSITION

YSI's legal incorporation and foundational internal controls are documented. Current Board verification, institutional bank-account evidence, safeguarding focal-point arrangements and implementation records remain active due-diligence priorities. These gaps are disclosed rather than treated as complete.
